Candidate Brief

Final Claude AI-Assisted Frontend Assessment

Project	FlowPilot Landing Page
Duration	4 hours maximum
Level	Junior Frontend Developer
Primary AI Tool	Claude
Project Type	Single-page responsive frontend
Backend / API	Not required

1. Assessment Objective

Build a responsive marketing landing page from the supplied Figma design while demonstrating disciplined, intelligent use of Claude throughout the frontend workflow.

- Understand requirements before coding.
- Break the design into sensible frontend components.
- Use Claude for planning, implementation of support, debugging, review, and verification.
- Make your own front-end decisions instead of blindly accepting AI output.
- Deliver a polished, responsive and functional React implementation within the time limit.

Important

Do not begin by asking Claude to build the complete website in one prompt. The assessment is designed to evaluate your workflow, prompting quality, iteration and engineering judgment.

2. Required Technology

- React
- TypeScript
- Tailwind CSS
- React Hook Form
- React Testing Library

`

3. Figma Handoff

A separate Figma file/link will be provided as the visual source of truth. It will contain:

- A complete 1440px desktop page.
- Mobile references for the header, open navigation, hero and contact form at approximately 375px.
- A component/state reference area for buttons, form controls, tabs, slider controls, pricing cards and mobile navigation.

A full mobile design will intentionally not be provided for every section. You are expected to determine sensible responsive behaviour for the remaining components.

4. Page Requirements

Section	Required UI / Behaviour
Header	Logo, desktop navigation, Log In, Get Started, responsive mobile hamburger menu.
Hero	Headline, supporting copy, two CTAs, trust notes, and a coded product/dashboard visual.
Trusted Companies	Simple horizontal company/logo strip.
Features	Four feature cards with icons, hierarchy and hover treatment.
Interactive Tabs	Plan / Automate / Collaborate tabs; one active tab; data-driven content changes.
Testimonials	Previous/next controls, active slide indicator and React-state-driven content.
Pricing	Starter / Pro / Business cards. Monthly pricing at initial handoff.
Contact Form	Validated form with conditional logic, submit state and success state.
Footer	Logo, short description, grouped links, social links and copyright.

5. Responsive Requirements

The page should work properly around the following reference widths:

- Mobile: 375px
- Tablet: 768px
- Desktop: 1440px

Do not simply stack the desktop design vertically. Consider layout, typography, section spacing, navigation, cards, forms, slider controls, pricing and footer behaviour at each breakpoint.

6. Functional Requirements

Mobile Navigation

- Open and close correctly.
- Display all navigation links.
- Close when a navigation link is selected.
- Remain usable with keyboard interaction.

Section Navigation

Navigation and relevant CTA buttons should move the user to the correct section of the page.

Interactive Tabs

Implement Plan, Automate and Collaborate tabs. Only one tab can be active at a time, and the content should be driven by reusable data rather than duplicated section markup.

Testimonials Slider

- Previous control
- Next control
- Correct active testimonial
- Active slide indicator
- React state-driven data

7. Contact Form

Field	Rule	Notes
Full Name	Required; minimum 3 characters	
Work Email	Required; valid email	
Company Name	Required	
Team Size	Required	1-10, 11-50, 51-200, 200+
Message	Required; 20-300 characters	Show live character count, e.g. 120 / 300
Terms	Must be accepted	

Conditional Form Logic

When Team Size is 200+, display a new required field called Preferred Demo Time with Morning, Afternoon and Evening options. If the user changes Team Size to another option, the field should disappear and must no longer block submission.

Submission Behaviour

1. Disable the submit button while processing.
2. Show a submitting state.
3. Simulate approximately one second of processing.
4. Prevent repeated submissions.
5. Show the success message: “Thanks! Our team will contact you shortly.”

8. Accessibility & UI Quality

- Use semantic HTML where appropriate.
- Maintain sensible heading order.
- Use real labels for form fields.
- Ensure buttons and controls have meaningful names.
- Provide visible focus states.
- Keep mobile menu, tabs and slider controls keyboard-usable.
- Make validation messages understandable and associated with the correct fields.
- Use subtle transitions/animations only where they improve the experience.

9. Component Thinking

Do not put the whole page into one component. Create reusable components when they improve readability and maintainability, but avoid turning every small element into an abstraction.

Possible examples include Header, Hero, FeatureCard, FeatureTabs, TestimonialSlider, PricingCard, ContactForm, Footer, Button and SectionHeading. You are not required to use these exact names.

10. Claude Role / Agent Requirement

Create at least three clearly defined Claude roles or agents. The exact prompts are part of the assessment and should be written by you.

Role	Responsibility
Project Planner	Understand requirements, review the Figma, break work into sections/components, identify reuse opportunities, define order of work and flag likely risks.
Frontend Implementation Agent	Help with React, TypeScript, Tailwind, responsive implementation, state, form validation, interaction logic and debugging. Provide it relevant project context.
Reviewer / QA Agent	After meaningful development, independently review responsiveness, accessibility, React structure, TypeScript, validation, interactions, maintainability and obvious bugs.

Prompting Expectation

Give Claude appropriate role, task, context, requirements and expected output when useful. Do not rely on repeated one-line prompts or a single huge prompt.

11. Debugging & AI Verification

Document at least one real issue encountered during development. Before asking Claude to fix it, identify the expected behaviour, actual behaviour and evidence you inspected (for example console output, component state, props, form state or browser layout).

You must also include at least one real Claude recommendation that you rejected, corrected or modified because it was wrong, incomplete, unnecessary or not suitable for the project.

12. Testing

Create at least three meaningful tests. Recommended coverage:

- Invalid form cannot submit.
- Team Size 200+ displays and requires Preferred Demo Time.
- A functional interaction such as tabs changes the displayed content correctly.

13. Required Submission

- Source code / repository.
- README.md with setup, run/test commands, technology, component structure, key decisions and known limitations.
- AI-USAGE.md.
- Minimum three meaningful tests.

AI-USAGE.md must include

- Agents/roles created, their responsibilities and initial prompts.
- One strong prompt and why it worked.
- One weak prompt and the improved version.
- One Claude recommendation you rejected or modified and why.
- One debugging example: problem, investigation, Claude prompt, fix and verification.
- Where Claude helped most.
- At least one meaningful decision you made yourself.

14. Time & Priority

The task is intentionally larger than what many candidates will fully polish within four hours. Prioritize. A partially completed solution with strong structure, correct behavior, good UI and verified work is better than a fully generated solution you cannot explain.

15. Final Candidate Checklist

- Project runs without important console errors or React warnings.
- Desktop, tablet and mobile layouts are usable.
- Mobile navigation works.
- Tabs work.
- Testimonial slider works.
- Pricing section is implemented according to the current requirement.
- Form validation and conditional field logic work.
- Duplicate form submission is prevented.
- Success state works.
- Keyboard/focus behaviour is reasonable.
- Tests run.
- README and AI-USAGE.md are accurate.

Final Rule

Do not rely on Claude telling you that the application is correct. Run it, inspect it and verify the behaviour yourself.
